I won't pretend it's one of my favorite parts of the Minneapolis park system, but one of the lovely creatures that these parks attract is the fall. I love the changing colors. I love the cooler temperatures. I love the crisp air. And every time I walk in these parks, I remember the warmth of a friend and hear the truth of one of the poet's great lines: Autumn and winter, spring and summer follow each other so closely that they seem but one; dear summer lingers till the spring's first sweet airs scatter the dun leaves; and March and April, mix in May, and the months decay. analog circuits, digital circuits, etc.

SoCs include a large number of functionality (e.g., digital functions) inside a single semiconductor chip which is fabricated in a process that is completely different than the process used to fabricate logic and memory elements on separate chips which are combined to make the SoC. On-chip interconnects and switching between various

functions in a SoC were not originally a focus of design effort, in part due to the complexity of the interconnections between functions.

In the past, the complexity of the interconnects in a SoC was not a major design issue because the SoC would include circuits having relatively small functions (e.g., microprocessors and embedded memories) that are relatively well-

separated from each other on the
chip. As On-chip interconnects and
SoC functionality become more
