Q: How do I find a path leading to an object of interest and then traverse that path? I have the following problem - I have a simple 2D puzzle where you click on a random square and it places a cube in the hole. I am using a while loop to check every square that's not already locked, and if it's in the correct square of the hole then I break out of the loop. My problem is, when I'm trying to create the queue of squares, I've created a queue of integers representing each square, because I can't think of a better way to do it.

The problem that I'm having is that I can't find a way to traverse the squares from my starting square. The code is below - while not queueDone.isEmpty(): if queueDone.pop().isValid(self.lock): #if a valid hole if

```
self.spaceField.isInLockPlacement(self.spaceField.lockPlacement, queueDone.pop()): #if the square is in the correct spot
```

```
self.spaceField.removeSquare() break else:
```

```
squares.append(queueDone.pop()) #append to the queue of squares
```

What would be a better way of doing this, if at all? A: If a square is a member of a queue, its index in the queue is just the same as its index in the list - the square is unique, it's the same unique item. You could use a list of tuples instead, and maintain the index (1, 2, 3), while the second element of the tuple is the square (4, 5,
