Most CAD software tools are based on a 3D model, such as the geometric shape, which is then converted into a 2D or 3D model. There are two types of CAD software: dedicated tools and desktop-based software. Dedicated CAD software is used for making 2D and 3D models for different purposes. CAD software can be used for creating a 2D or 3D model for engineering, architectural, industrial and product design, manufacturing, utility, mechanical, structural, building, plumbing and civil engineering. It can also be used for making a plot plan, architectural drawings and diagrams. AutoCAD is an example of a dedicated CAD tool. Desktop-based CAD software is available as a full-featured package or as a package that is easier to use and requires less comprehensive training. It includes all the features of the full-featured package and is a software package that runs on your computer. Malignant lymphomas are rare in native kidneys of pediatric patients. Because of the paucity of data, the authors analyzed the demographics, clinical manifestations, pathologic features, and outcomes of children and adolescents with native kidney lymphomas. A retrospective review of the National Cancer Data Base was performed to identify patients younger than 18 years who were diagnosed with native kidney lymphoma between 1997 and 2006. Clinical, pathologic, and treatment-related variables were collected and compared. A total of 29 patients met the study criteria, 23 (79%) of whom were male. The median patient age was 15 years (range, 3 to 18 years), with a median follow-up of 17 months (range, 0 to 119 months). Fifteen (51%) had follicular lymphomas. Twenty-two (76%) patients presented with constitutional symptoms. Among 23 (79%) patients who received an initial treatment, complete remission was achieved in 19 (83%) patients, with 2-year event-free survival of 74%. The presence of B symptoms, bone marrow involvement, low CD4 count, and renal insufficiency portended a more aggressive disease at diagnosis and worse outcome. Patients treated with combination therapy had significantly longer event-free survival than those treated with monotherapy ($P = .05$). Children and adolescents with native kidney lymphomas are more likely to present with constitutional symptoms than adult patients. The overall response to therapy is excellent. Children with a poorer performance status, B symptoms, and bone marrow or renal involvement are more likely to have a disease relapse./** Copyright (c) 2017-2018 THL A29 Limited, a Tencent company.
